

ABSTRACT OF THE INVENTION

The present invention comprises a method for the treatment of cancerous tumors in mammals comprising the administration of an effective amount of an immunostimulator which enhances and potentiates the mammals own immune system to selectively attack and kill the cancerous cells. The immunostimulator, preferably urushiol, is administered in a pharmaceutically acceptable carrier and can be co-administered in conjunction with other immunostimulators, radiation therapy or other cytotoxic anti-cancer agents to further enhance their effect.
